

Business Case Project (AI-assisted)

Proposal on FinTech Application and Disruption

General Description

This project should be done individually (assisted by Generative AI or other AI tools). Each student is expected to propose a specific business application (use case/startup pitch) related to financial technologies (e.g., blockchain, new digital financial products) learned from the class, and students are required to interact with AI tools (e.g., Deepseek, ChatGPT, Gemini, Claude) to improve the business proposal. The proposed business idea should be generated based on students' own human intelligence and be reinforced by artificial intelligence. Innovative ideas are highly encouraged. Score punishment will be applied if the idea was originally generated by AI.

Submission:

- (1) A written report for the business proposal***
- (2) A dialogue record between each student and their AI assistant***

- Due by the presentation day in week 9.
- Double-spaced, with cover page. Font size at least 11.
- Correct citation with APA format.
- Length range 3-5 pages, including any graphs, figures, and tables.

*Same format requirements for both proposal and AI-human dialogue record.

This project will account for 20% of the overall course grade. Points will be assigned based on:

- (1) Contribution
- (2) Novelty
- (3) Degree of completion
- (4) Quality of human-AI interaction

Expectations

The students are expected to conduct the following work:

- Research the topic by reading papers or articles
- Discuss and provide ideas on innovation, business model, and implementation of FinTech.
- **The proposed idea should not be any widely used or observed business up to 2026.**

- Contribute to writing, data collection (if needed), and coding (especially if your proposed idea is based on inferences you draw from the market statistics).
- In your proposal, make sure you cover both the business and technical aspects, including **the problem you aim to solve, the solutions you provide, the potential challenges/competitors, the market/revenue sources, etc.** Some summary statistics are expected for each proposal, but the majority weight will be on the business design and solution.
- Quality interaction with an AI assistant. **Students are required to use Generative AI tools to improve their business proposal, and credits will be extended based on the depth/breadth of the recorded AI-human conversation.**

Suggested Resources

- Review class notes and reading articles provided in this course.
- News media (Bloomberg Businessweek, WSJ, Financial Times, etc.) also provide coverage on blockchains in general.
- Government policies or announcements.
